## - Fungi -

Fungus is found throughout the world, and is common in the Australian Bush.

It prefers moist to wet environments, though some species can survive in drier temperatures for periods of time.

Can you help identify any of these outstanding natural wonders?

Any help appreciated.

# FUNGI

Fungi is a member of a large group of organisms / microorganisms that include mushrooms, toadstools and yeast based organisms. They are non-chlorophyllous and reproduce by spores and live as either parasites or saprophytes.

A parasite is an organism which depends for its nutrition on another plant. Many bracket fungi are parasitic appearing on the surface of tree trunks and bring about the decay or death of the trees upon which they live.
