Nature

- Lichen -

Lichen is found throughout the world, and is common in the Australian Bush. It prefers moist to wet environments, though some species can survive in drier temperatures for periods of *time*.

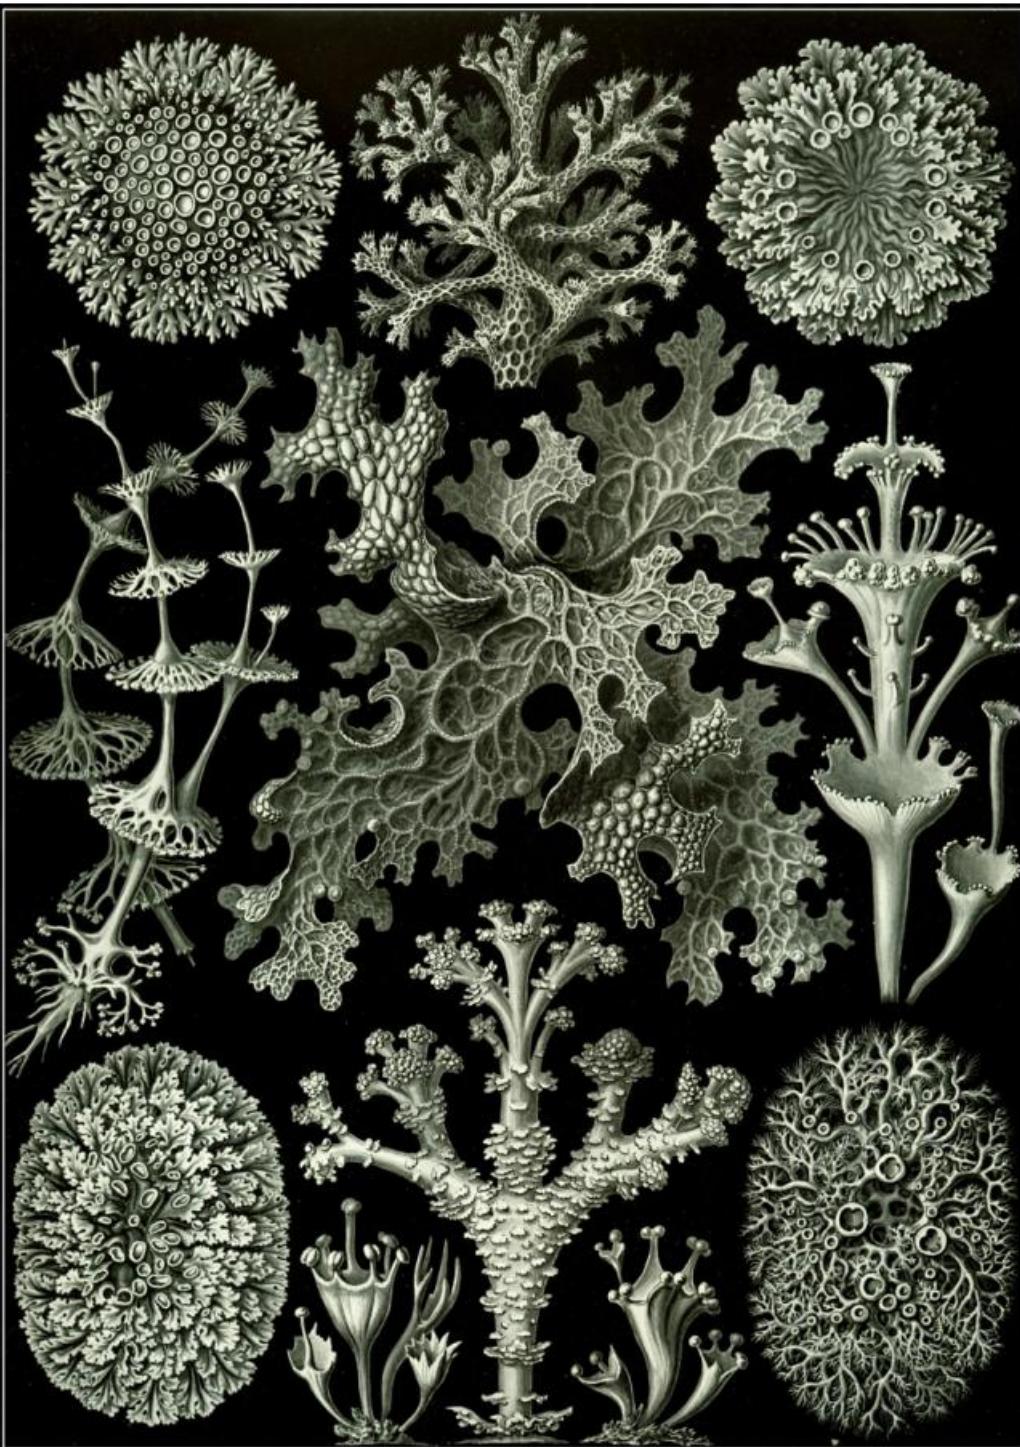

Can you help identify any of these outstanding natural wonders?
Any help appreciated.

LICHEN

Lichen is a type of self supporting composite organism which is the result of a symbiotic relationship between fungi and certain types of algae. It is often green in colour.

There are over 20,000 species of lichen world wide.
